*Introduction to the irregular
Riemann-Hilbert correspondence*

Abstract:

In this talk, I will explain the basic idea behind the Riemann-Hilbert correspondence. It is a correspondence between two different moduli spaces: the de Rham moduli space parametrizing meromorphic differential equations, and the Betti moduli space describing the representations of the fundamental group defined by their solutions. We will see why such a correspondence breaks down for higher order poles.

Keywords: monodromy representation · meromorphic connection
